

José G. Funes, S.J.

Date of Birth 31 January 1963

Place Córdoba (Argentina)

Nomination 5 August 2006

Field Sciences of the Universe

Title Professor

Professional address

Most important awards, prizes and academies

Argentine Astronomical Society; American Astronomical Society; International Astronomical Union; Pontifical Academy of Sciences.

Summary of scientific research

José Funes specialises in extragalactic astronomy. His field of research includes the kinematics and dynamics of disk galaxies and star formation in nearby galaxies. For his doctoral thesis he studied kinematic properties of the ionized-gas component in their inner regions of disk galaxies. The analysis of the emission lines for each galaxy allowed the identification of galaxies which are good candidates to host a supermassive black hole, which in the standard paradigm are believed to be nearly ubiquitous in galaxy centres. He has studied the correlations between supermassive black-hole masses and global properties of disk galaxies. He is currently studying one of the major problems in Astrophysics, the understanding of galaxy formation. In this process, the history of the star formation rate in the universe plays a very important role. Funes is a member of a team that is conducting a deep imaging survey using the Vatican Telescope in Arizona. These data in combination with GALEX observations (Galaxy Evolution Explorer, one of NASA's space telescope) will provide in-depth information on the distributions of local star formation in terms of galaxy types, luminosities, and interstellar environments, and provide critical tests of the methodology used in constructing the history of the star formation rate in the local universe. In addition, he studies star formation in satellite galaxies and elliptical galaxies with dust lanes. The formation and evolution of early-type galaxies is not completely understood yet. The study of ionized-gas distribution and star formation properties in elliptical galaxies with dust lanes can shed light on the formation process of early-type galaxies.
